AMENDMENTS TO THE ABSTRACT

Please replace the Abstract with the following paragraph:

A remote client interface to manipulate OLAP and other reports is described. A Web client or other thin client may access an intelligence server via an intermediate network server. The network server may translate between HTML or other code supplied by the client, in order to access a database serviced by the intelligence server in all its functionality. For instance, a user may clink onto a linkable URL to access a stored report run against the remote database, and perform operations on that report, such as doing a table pivot, page down, running totals or averages, or other functions. Multiple users may access the report and other data resources using different interfaces.
